INTERMATIC® INCORPORATED

INTRODUCTION

This easy to program microprocessor-based time switch provides flexible 24-hour, 7 day or full year load control. Its unique "self-prompting" feature simplifies programming by leading you through with flashing prompts. The LEDs on the left side flash and indicators in the digital display light while you are programming to identify information that needs to be entered.

SET UP information must be entered first, followed by the PROGRAM information. PROGRAM is used to set the switching times of the loads controlled by the time switch. Switching times can be programmed in any combination of:

Fixed–Switch ON times and/or Switch OFF times that are based on a user-selected time of day and can only be changed by reprogramming.

Pulse–The same as fixed times except the ON or OFF operation occurs only for a short duration (1 to 127 sec.) as required for bell ringing, signal control or the operation of latching relays.

Interval–The same as Pulse times except for a longer duration (from 1 min. minimum up to 6 days, 23 hrs., 59 min.). Interval and Pulse also allow programming for a user selectable override.

Astro–Based on the changing times of sunset and sunrise.

Before proceeding with programming:
- Read the instructions on pgs. 3–17
- Review the programming example on pgs. 17–19
- Complete the charts on pgs. 20–23
- Install time switch, connect ground wire as shown on pgs. 26–28
- Complete wiring by referencing examples on pgs. 29–32

While programming be sure to assign the various switch times to the appropriate loads with the Enable switch (2 circuit models only). When you are finished, the REV (Review) key allows you to check the program before leaving the installation.

LED DISPLAY

The red LED display prompts and indicates data as it is entered in SET UP and PROGRAM. The display indicates current time in the RUN mode. Note the dual captions above and below the display.

RESET ⊙

Operation begins with RESET, followed by data entry with the keypad. Pressing RESET initializes the time switch by testing and clearing the working memory and turning off all circuit loads. (Pressing RESET during programming will cause all data just entered to be lost.) To clear all existing program and setup data, press and hold the CLEAR key, then press and release RESET. Continue to hold CLEAR until RESET appears in the display.

RUN/SET

☐ RUN
  SET

You must have this switch in the SET position to enter, review or clear data. When you have finished, slide the switch to RUN to automatically save the data into non-volatile memory. If entering a large number of set points, you may wish to periodically move the slide switch to RUN to save your data. Return to SET after SAVE disappears from the display and continue programming. If a power outage occurs and you are in SET, all data not saved will be lost. The data is permanently stored unless the memory is deliberately erased (by pressing RESET while holding down the CLEAR key). Data can only be modified by the user. In the event of power failure the non-volatile memory holds the data even if the battery backup should fail. When moving this switch to RUN, the message SAVE briefly appears in the display. When moved to SET the message RECALL appears briefly.

Data entry falls into the two categories shown on the front panel: SET UP and PROGRAM.

✕NTERMATIC®
Next Generation

▼ SET UP

SET UP is performed once during installation to set the internal CLOCK, ASTRO (sunrise/sunset) times and HOLIDAY references. After entering and okaying the ASTRO Zone, the timer will display calculated "center of time zone" times when prompting for sunrise and sunset entries. You may OK these, enter actual sunrise/sunset times or enter offset times for early or late ASTRO operation. Sunrise time must be before noon; sunset time must be after noon. Sunset must not be within 5 hours of sunrise. Both sunrise and sunset must be entered, even if only one is used for switching. If neither is required, you may skip ahead by pressing HLDY or PROG keys. (See map pp. 24–25 for details.) Holidays are entered with 2-digit reference numbers; a chart for recording the date(s) is located on page 22. Leap years are preset through the year 2094.

▼ PROGRAM

PROGRAM is used for entering or changing the switching schedule for loads wired into the time switch. You can program circuits separately or concurrently. Each entry affects loads whose Enable switches are in the enable position at the time of data entry (2 circuit models only). The time switch is shipped in a 12-hr. AM/PM mode; you can change to 24-hr. by removing a jumper on the circuit board (see Special Instructions). It can store a minimum of 400 events, depending on the data type entered.

The time switch prompts you through SET UP and PROGRAM with LEDs that advance after each entry. There are five important points to remember:

1) The RUN/SET switch must be in the SET position to enter, review or change data.
2) You must press "OK" after each entry, before starting the next.
3) You must press AM or PM after entering time (unless programming Sunrise and Sunset or in 24-hour mode).
4) When in PROGRAM you must select the loads you want to control with the Enable switches (2 circuit models only).
5) RUN/SET switch must be returned to RUN position to enable automatic control and to save changes to data.

KEYPAD

SUN 1	MON 2	TUE 3	WED 4	THU 5
FRI 6	SAT 7	WKDY 8	WKND 9	ALL 0

These keys are used for most data entry. Note dual functions, numeric or day specific. Using the day group keys WKDY, WKND and ALL (for all 7 days) greatly speeds the process.

The keypad keys are only functional when the RUN/SET switch is in the SET position. Pressing keys when in the RUN position will cause a message to scroll, explaining the function of that key. Press any key once to stop any of the scrolling error or help messages.

AM	PM	PULSE	INTVL	ASTRO

You must press AM or PM after entering time data (except Sunrise or Sunset) unless in 24-hr. mode. Programming fixed times for ON and OFF events does not require PULSE, INTVL or ASTRO keys. Multiple ONs or OFFs can be entered by pressing OK without programming the alternate OFF or ON. Multiple OFF times are frequently used to "sweep" off loads which have been manually switched on after normal occupancy hours.

PULSE and INTVL (Interval) are length-of-time based options. Maximum Pulse is 127 sec.; minimum is 1 sec. Maximum Interval is 6 days, 23 hrs., 59 min.; minimum is 1 min. To program Pulses or Intervals, press the PULSE or INTVL key after entering a Switch On or Switch Off time; then enter the required duration and press OK. Note after ON Pulses or Intervals have timed out the load will be OFF, and after OFF Pulses or Intervals have timed out the load will be ON, regardless of the load state prior to the start of the Pulse or Interval. The INTVL and PULSE keys include a temporary override function with a maximum length of 6 days, 23 hrs. and 59 min. for the interval or 127 seconds for the pulse. To program an interval or pulse for override, select SET, enable the circuit, press PROG, press INTVL or PULSE (*without* selecting a day), key in the interval or pulse

INTERMATIC
Next Generation

duration, then press OK. Remember INTVL or PULSE override is initiated on demand via the keypad and is not based on a day and time, as is normal INTVL or PULSE. To initiate an override interval or pulse first set the RUN/SET switch to RUN and set the switch for the desired load to Enable, then press the ON/OFF key for the load you wish to override. The green load indicator flashes during the interval or pulse to show override selection. At the end of an override interval or override pulse, the load and green LED will turn off, unless a programmed ON event has occurred during the override time period. This allows the override interval to be used as an "early ON" as well as a "late OFF" override after normal hours of operation without interfering with normal scheduled ON/OFF times.

The load *will* respond to any subsequent program schedules. You may also initiate an override interval or pulse by pressing and holding the INTVL key, then pressing the ON/OFF key for the Enabled circuit you wish to override. This allows an override to be started without turning off a load that is already on. This is useful for HID lighting applications where even a brief turn off will cause loss of lighting for several minutes. Note that override can only be set for an interval or pulse, not both.

An override interval or pulse may be ended early *only* by pushing the ON/OFF key or by a power interruption. Thus, a programmed OFF event will not end an override interval or pulse. At the same time, any ON or OFF events which occurred during the override period will be in effect at the completion of the override time period. This allows applications such as a programmed ON time of 8:00 A.M. with a 2 hour interval override initiation at 7:30 A.M. At 9:30 A.M., after the two hour override, the lights will remain ON since during the override period they were programmed to switch ON (at 8:00 A.M.). The override pulses are precise to-the-second whereas override interval duration is the program duration ± 30 seconds, dependent on the instant in time when the override was initiated.

ASTRO is pressed (instead of a time entry) after selecting a day or day group if you want switching to occur at Sunrise and/or Sunset. If ASTRO is pressed during the "Switch On" prompt, the timer prompts for sunset. If ASTRO is pressed during the "Switch Off" prompt, the timer prompts for sunrise. For applications requiring an ON event at sunrise and/or an OFF event at sunset, press AM or PM respectively to toggle the sunrise/sunset prompts.

Interval programming may be used to extend the "Switch On" and "Switch Off" times of ASTRO schedules. This is useful when some circuits require differing offsets from the ASTRO ON/OFF times that were entered during SET UP. To use this feature, enter the earliest required ASTRO ON/OFF times during SET UP, then use intervals of various durations to delay the ON/OFF times as required. Specifically, use an ON interval to delay an ASTRO turn OFF time and use an OFF interval to delay an ASTRO turn ON time. Refer to the "Programming Examples" booklet for detailed instructions. To program ASTRO switching with a Pulse or Interval, press ASTRO, then PULSE or INTVL, followed by entering a pulse or interval duration. . .all before OK is pressed.

(Clock adjustment for Daylight Savings Time (DST) is automatic; see Special Instructions for override if DST adjustment is not required, such as in Arizona, Hawaii and parts of Indiana. The clock time will be adjusted by 1 hour on the first Sunday of April and the last Sunday of October at 2:00 A.M. Due to unexpected results, it is recommended you do not attempt programming from 12:00 midnight to 2:00 A.M. on these two days.)

INTERMATIC®
Next Generation

PROG REV SET UP HLDY PROG (Program) and SET UP return you to the beginning of these categories. Press **PROG** to select a new day/day group when programming of a selected day/day group is complete, or to skip Astro and/or Holiday prompts during SET UP.

REV (Review) allows you to check SET UP or PROGRAM data. The holidays will review in chronological order regardless of the order in which they were entered. CLEAR is used during Review to delete displayed data if changes are required.

The Holiday (HLDY) feature allows the timer to follow special schedules on selected days or periods of days, based on the date instead of the usual 7 days of the week. Although Holiday schedules are normally used to modify or suspend regular weekly switching activity on actual holidays, the Holiday feature also allows a variety of special scheduling options that are not satisfied by the 7-day repeating schedule. See Programming Examples supplement for details. Each holiday may be one day long or as many days as necessary. Although each has a reference number (1–99) that you assign, Holidays occur and review in chronological order, so the order of the reference numbers does not matter.

HLDY (Holiday) allows you to set up or review Holiday data. If a holiday is a single day, press **OK** when prompted for the Stop date, or enter the same date. Holiday scheduling applies to both circuits of 2 circuit models. If you need to switch loads on a holiday, press **PROGRAM**, press **HLDY**, enter the reference number 1–99 for that holiday, then press **OK**. Program the holiday load schedule just as you would any day or day group. If you do not program switching times for holidays, the loads will be inactive during the holiday period; all loads will remain in the state they were at 11:59 P.M. on the day preceding the start of the holiday. You may program Off events at 12:00 A.M. on holidays to guarantee loads are off during holidays. Note the Stop date is the last day the loads will be inactive or under special program control. The following day the loads will resume normal scheduling beginning at 12:00 A.M. Press **PROG** to exit the holiday mode after entering the last holiday.

Holiday schedules and dates will remain in timer memory until deliberately cleared. For those Holidays whose dates vary from year to year, you must manually revise the start and stop dates (in SET UP review) annually. Holidays may not be programmed to end before their start date and must end by Dec. 31. During days when the timer is following a Holiday schedule the "REF#" LED will blink to indicate that Holiday scheduling is in effect.

OK CLEAR COPY HELP The **OK** key must be pressed after each complete entry; pressing it advances you to the next data prompt. The **OK** key is similar to an Enter key. After okaying a switching time, the timer automatically prompts for the alternate switching activity; i.e. Off after On, On after Off (except after a pulse or interval entry). Pressing the **OK** key without making another switching time entry alternates the On/Off prompt, allowing a succession of Off or On events. **OK** is the *final step* after programming all steps and enabling circuits for each switching time/type.

CLEAR clears the last digit entered; additional digits are cleared from the display each time **CLEAR** is pressed. CLEAR is also used to clear an error code or message and return the display to the same data that appeared before attempting to OK the data. While in Review pressing **CLEAR** deletes the displayed data from the program for the load(s) selected with **Enable**. Press **REV** to continue Review.

COPY allows you to use the same schedule for groups of days other than those available on the keypad (WKDYs, WKNDs or ALL). Simply press **COPY** after entering a schedule for a specific day, and at the DAY prompt key in the day you wish to copy to, then press **OK**. You may also copy a day that was previously programmed by pressing that day's key, pressing the **OK** key, then the **COPY** key. The display will show the selected day followed by COPY. Now key in the day you wish to copy to and press **OK** to confirm. Select and **OK** additional copy to days as required.

Four rules need to be followed when using COPY:
1) You cannot copy to a day that has already been programmed.

INTERMATIC®
Next Generation

2) You cannot <u>copy from</u> a day which has already been <u>copied to</u>.

3) You cannot <u>copy to or from</u> a day group.

4) The COPY feature copies the programmed schedules of all the circuits of the <u>copy from</u> day to the corresponding circuits of the <u>copy to</u> day regardless of the positions of the circuit **Enable** switches. Individual circuit schedules may not be copied independently (2 circuit models only).

HELP provides help messages specific to each step in SET UP and PROGRAM. If you make an error, it will be indicated in the LED display with an error code. (See Error Messages at the back of this booklet, or press **HELP** to scroll the message across the display.) Pressing any key or allowing the message to finish returns the display to the condition before the error was made.

LOAD CONTROLS
There are two controls and an LED indicator for each load. **Enable/Disable** activates automatic switching of the load by the time switch, enables the override function in **RUN** mode and selects circuits being programmed in **SET** mode.

The **ON/OFF** key manually switches the load independently of the time switch and cancels any previously initiated activity, including PULSEs, INTVLs (Intervals) or override intervals and override pulses. If an override interval or pulse has been programmed, pressing the **ON/OFF** key of a circuit that is Enabled will initiate that override. In order to manually switch the load ON or OFF in this situation, you must slide the **Enable/Disable** switch to **Disable**, press the **ON/OFF** key, then return the slide switch to **Enable** in order to allow the time switch to follow subsequent set points. The **ON/OFF** key does not interfere with events that occur after its use. The ON/OFF keys and LEDs will operate the loads and indicate status regardless of the position of the RUN/SET switch.

The green LED is ON when the normally open contacts are closed. Typical wiring methods will mean that the green LED is ON when the load is ON. Verify this by trial and error if in doubt. If the circuit is on due to an override interval or pulse, the green LED will be flashing.

When timer power is restored after a power interruption, all loads will initially be OFF. The timer then restores any enabled loads to their programmed status as of mid-night (12:00 AM) of the present day. For this reason, for ON periods that include midnight, if load operation is desired immediately after power restoration, use a redundant ON set point at each affected midnight (12:00 AM) to guarantee predictable catch-up. Using this same technique is recommended when Astro ON periods include midnight.

If both loads are scheduled to turn ON (2 circuit models only), the soft start feature will turn circuit 2 ON 15 sec. after circuit 1. Therefore, it is generally advisable to put lighting loads on circuit 1 to hasten turn-on after power is restored. All same-scheduled loads turn <u>OFF</u> simultaneously at the scheduled time. If a soft start is not desired, program those loads using interval or pulse.

If a soft start other than the factory setting of 15 seconds is desired press **SET UP**; and the date will be displayed. Then press **PULSE**: SS (for Soft Start) appears in the left two displays with 3 dashes in the rightmost displays. Enter the soft start desired by keying in a number from 1 to 127 seconds, and then press **OK**. This new soft start allows you to lengthen or shorten the 15-second soft start and will affect all available circuits.

Loads that are operated by pulses (such as latching contactors) may not be restored to the expected condition if any ON/OFF pulses occurred during the power interruption. Consider using fixed ON/OFF schedules in conjunction with either self-clearing contactors or contactors adapted for "two wire control".

INTERMATIC®
Next Generation

INSTRUCTIONS FOR REVIEWING/REVISING DATA

REVIEW PROCEDURE
• Place the RUN/SET switch in the SET position to review.
• You must review Clock info (date, time), Astro and Holiday dates in SET UP mode.
• You must review all load activity (Fixed times, Astro times, Pulse operations, Interval operations and special "Holiday" load activities) in PROGRAM mode.
• In PROGRAM, select only one load at a time using the Enable switch (2 circuit models only). If both circuits are enabled, you will only see switch activities common to both.

REVIEW CLOCK, CALENDAR, ASTRO DATA AND HOLIDAY DATES
To initiate review, press SET UP (the date is displayed), then press REV (Review). Continue to press REV for each program you wish to review. SET UP stops after the time is displayed if no Astro information has been entered, allowing you to enter Astro data (Zone, Sunrise and Sunset). If Astro information has been entered, pressing REV after reviewing the Sunset time will cause the message "End of Review" to be displayed. Review will then automatically advance to HOLIDAY, allowing you to select a specific holiday reference # (01–99) for review. If you want to review all holiday dates, press REV without selecting a reference number, and the first holiday reference # will appear. (This will not necessarily be reference #1 since holidays review in chronological order beginning January 1st). Continue to press REV to walk through the Ref # and the Start and Stop dates for each holiday until "End of Review" is displayed. For single day holidays, Start and Stop dates will be the same. Note that Astro sunrise and sunset times are re-calculated daily by the timer and will differ from times entered or reviewed on a previous date.

REVISE SET UP DATA
To revise or delete displayed information during Set Up Review, simply press CLEAR. When reviewing Astro Sunrise and Sunset times, you may need to press CLEAR more than one time since each operation deletes only one digit. You can then immediately make the revision. Be sure to press OK to enter the new data.

Note that after any revisions to the sunrise Astro time, the sunset Astro time must be re-entered and okayed. Press REV to continue the review.

REVIEW PROGRAM
• Be sure to select one load at a time (2 circuit models only). Failing to do so will allow you to only review switching activities which are common to both circuits. In other words, if both are enabled and are both programmed to come On at 8:00 A.M., but Off at different times, the 8:00 A.M. On time will be the only set point shown in Review. You must be in the PROGRAM mode in order to review the programmed load activities.
• In the PROGRAM mode, you can review switching activities regardless of whether you programmed them as Fixed Times, Astro Times, Pulse Switching or Interval Switching. Special Holiday load activities or interval overrides are also reviewed in Program.

REVIEW WEEK LONG SWITCHING ACTIVITIES
The normal load switching schedule is a composite of all applicable individual day schedules, day group schedules and copied days. The week long review feature allows this composite schedule to be easily reviewed; by simply pressing the REV key repeatedly, without first selecting a day, the timer will step thru all scheduled switching times chronologically, beginning at 12:00 A.M. Sunday, or by pressing the REV key once, then pressing the OK key, the timer will automatically step thru each scheduled switching time, displaying each time for about 2 seconds. Press the OK key to pause auto review. Press the OK key again to resume auto review; or press the REV key to continue review manually. The scheduled switching times may only be reviewed, not cleared during week long review. Follow the steps below for individual day/day group review if any scheduled events need to be cleared.

XINTERMATIC®
Next Generation

REVIEW INDIVIDUAL DAY, DAY GROUP, OR COPIED ACTIVITIES

• Press **PROG**, then press the day key (**SUN/1** through **SAT/7**) or the day group key (**wkDY/8**, **wkND/9** or **ALL/0**) to select the day or day group to review.

NOTE: If you have entered data as a day group and attempt to review any of the days individually, the message "End of Review" will be displayed. This is because you must review data just as it was entered, in this example, as a day group.

• Press **REV**, at which point the colon will disappear. Press **REV** again to review the first programmed switch time. The associated Switch On or Switch Off LED will be lit.

• Press **REV** again to review the next activity. If a switching time includes a pulse or interval when you press **REV**, the length of the pulse or interval will be displayed and the LED for PULSE or INTVL will be lit. Continue to press **REV** until "End of Review" is displayed. The display now prompts for a new day or day group selection. Repeat the steps above for each circuit individually.

• To automatically review a day or day group, press **PROG**, select a day (**SUN/1** thru **SAT/7**) or day group (**wkDY/8**, **wkND/9** or **ALL/0**), press **REV**, then press **OK**. If desired, press **OK** again to pause auto review; press **OK** again to resume review, or press **REV** to continue reviewing manually.

• If a day was copied from, you may review all days it was copied to by selecting the copy from day, pressing **OK**, pressing **COPY**, then pressing **REV**. For example, display might show 1 COPY 2 meaning that the day 1 schedule has been copied to day 2. Push **REV** more times to review additional copy to days. If a day is a copy, you may determine the day it was copied from by selecting the day then pressing **REV** twice. A message will scroll indicating the day it was copied from.

• Individual day review is not recommended for verifying predicted operation of the timer because, since the actual schedule is the composite of days, day groups, and copied days, all of these would need to be reviewed, then manually combined, to know the actual schedule for a given day. For example, if the weekday (8) day group has scheduled activity, but no individual weekdays (Monday thru Friday) have scheduled activity,

reviewing Monday only would immediately give the "End of Review" message, indicating no activity, yet there will be activity on Monday due to the weekday (8) day group schedule. Therefore, always use the week long review feature for final verification of the complete schedule.

NOTE: The effect of Holiday schedules cannot be seen during week long review, so in addition to week long review, all Holidays should also be reviewed to accurately predict the timer's operation.

REVIEW SPECIAL HOLIDAY SWITCHING ACTIVITIES

To review special holiday switching activities, press **PROG** then **HLDY**. Next enter the holiday reference number (01 to 99) for the holiday activities you wish to review. Press **OK**, then press **REV**, at which point the colon will disappear from the display. Press **REV** again to display the first switching activity. Continue to press **REV** while observing the LED prompts and program times and/or Pulse and Interval times until "End of Review" is displayed. Automatic review can also be used by pressing **PROG**, **HLDY**, then entering the Holiday reference #, **OK**, **REV**, then **OK**. If desired, press **OK** key to pause and resume auto review.

REVIEW OVERRIDE INTERVAL/OVERRIDE PULSE OPERATION

• Press **PROG** and do not select a day or day group.

• Press **INTVL**. The interval duration in days, hours and minutes as programmed will be displayed.

• Press **PULSE**. The pulse duration in seconds as programmed will be displayed.

• When reviewing data, the appropriate **Enable** switch must be used, one switch at a time.

REVISE PROGRAM DATA

When revising program data, make note of the following:

• RUN/SET switch must be in SET position

• Data is revised by causing it to be displayed during Review, deleting it with the **CLEAR** key, and then replacing it with new data, if desired.

INTERMATIC®
Next Generation

- Program data may not be revised during week long review. You must revise the data by reviewing the appropriate individual day, day group, or "copied from" day.
- During automatic review, the OK key must be used to pause the display before the displayed data can be deleted.
- After any program data is cleared, review is terminated. The timer is now in the program mode for the selected day, anticipating a new entry. You may make the new entry, restart review, or return to RUN position.
- It is recommended that you repeat the "week long review" after any revisions are complete to verify that all revisions were implemented as desired.

To revise or delete displayed information during Program Review, simply press CLEAR. You can then immediately make the revision desired. Be sure to press OK to enter the new data. Press REV to restart the review. Note that you can delete a Pulse or Interval option from any Switch On or Switch Off time by pressing CLEAR when the time is displayed during Review. You must re-enter, then OK the Switch On or Switch Off time, even if it has not changed. Likewise, you may add a Pulse or Interval to a Switch On or Switch Off time by pressing CLEAR when the time is displayed. You must re-enter the time, press PULSE or INTVL, enter the length of Pulse or Interval, then press OK.

REVISE/DELETE HOLIDAY SCHEDULES AND DATES

- To revise holiday Start/Stop dates: Press SET UP, then HLDY, then the Holiday # (if known), then REV. The selected Holiday # will show. Press REV again; the START date will show. Pressing CLEAR will delete the START and STOP dates. Enter the new START date, then OK. Enter the new STOP date, then OK.
- To revise holiday schedules: Press PROG, then HLDY, then the Holiday #. Press REV until the time that requires revision is displayed. Press CLEAR to delete the displayed time. Enter and OK a new time if desired.

- To delete a holiday# (and thus its Start/Stop dates) that has never had any scheduled On/Off times: Press SET UP, then HLDY, then the Holiday #, then REV, then CLEAR. If the display shows "__", the Holiday has been deleted. If "ERR 22" shows, this Holiday has, or once had, a schedule. If so, press any key to clear the error message then follow the steps below.
- To delete a holiday# (and thus its Start/Stop dates) when the holiday has or once had scheduled On/Off times: Enable any circuit, press PROG, then HLDY, then the Holiday #, then REV. The selected Holiday # will show. Press CLEAR; the timer will scroll a message asking if you are sure you want to delete the Holiday schedule. After the message stops and the Holiday # is re-displayed, press CLEAR to delete it. Now press SET UP, then HLDY, then the Holiday #, then REV, then CLEAR. The holiday is now completely deleted.

PROGRAMMING EXAMPLE (2 circuit timer)

Be sure RUN/SET switch is in SET position. At the initial installation and/or to clear out all previously programmed data, press and hold the CLEAR key, then press and release RESET and continue to hold the CLEAR button until RESET appears in the display. Note leading zeros are not required for the left-most prompted digit.

Press SET UP (unless prompt is flashing at Day of Wk/Time)
Assume
- Current date is January 21, 1997
- Current time is 2:30 P.M.
- Location is Des Moines, Iowa (Zone 5 from Astro Zone Map and center of Central time zone)
- The building owner wants the lights Off 30 min. after sunrise and On 30 min. prior to sunset.
- Two Holiday or special schedules – July 4th and a 2-week office closing 12/22/97 thru 1/5/98

XNTERMATIC
Next Generation

Press 1, 2, 1, 9, 7, OK (selects date); 2, 3, 0, PM, OK (selects time); 5, OK (selects zone). The time switch now displays the calculated center of time zone sunrise time of -7:33 A.M. Since the building owner wants to offset actual sunrise time by having lights switch off 30 min. late, press CLEAR, CLEAR, CLEAR (deletes automatic center of zone calculation; display now shows --:--) and 8, 0, 3, OK (selects new offset sunrise time). The time switch now displays the calculated center of time zone sunset time of -5:13 P.M. Since the building owner wants to offset actual sunset time, press CLEAR, CLEAR, CLEAR (deletes automatic center of zone calculation; display now shows --:--);
4, 4, 3, OK (selects new offset sunset time);
1, OK (selects <u>first</u> Holiday schedule Ref. # for 1997);
7, 0, 4, OK, OK (pressing OK twice selects same start and stop date);
2, OK (selects <u>second</u> Holiday schedule Ref. #);
1, 2, 2, 2, OK (start date); 1, 2, 3, 1 OK (stop date);
3, OK (selects <u>first</u> Holiday schedule Ref. # for 1998);
1, 0, 1, OK (start date) and 1, 0, 5, OK (stop date).
SET UP is now complete.

Press PROG (to enter PROGRAM mode and exit SET UP)
Assume • Programming for two loads:
   #1 indoor lighting, #2 buzzer
   • Load 1 switches On 7:50 A.M. to 4:40 P.M. Monday thru Friday and 7:50 A.M. to 12:00 P.M. noon Sat. only.
   • Load 2 operates the signal twice daily for 15 sec. at 8:00 A.M. and 4:30 P.M. Monday thru Friday only.
Set Load slide switches to Enable Load 1 and Disable 2
Press WKdy/8, OK (selects weekdays only); 7, 5, 0, AM, OK (load On time); 4, 4, 0, PM, OK (load Off time)
Set Load slide switches to Disable Load 1 and Enable 2
Press 8, 0, 0, AM, PULSE, 1, 5, OK (selects 15 sec. load On at 8:00 A.M.); 4, 3, 0, PM, PULSE, 1, 5, OK (selects 15 sec. load On at 4:30 P.M.)
Press PROG to select a new day or day group to program.

Set Load slide switches to Enable Load 1and Disable 2
Press SAT/7, OK (selects Saturday only); 7, 5, 0, AM, OK (load On time); 1, 2, 0, 0, PM, OK (load Off time)

Scheduled PROGRAM is now complete.

Assume A 30 min. INTERVAL override duration is desired for Load 1.
Set Load slide switches to Enable Load 1 and Disable 2
Press PROG (completes programming for Saturday data)
   INTVL, 3, 0, OK (sets user selectable interval duration to 30 minutes)
   (Note a <u>day or day group is not selected</u> since Interval override is selected <u>on demand</u> by the building occupants.)

Interval override duration selection is now complete.
   The interval override will not begin until called for by the user via the front panel pushbuttons.

To complete programming, download all data into non-volatile memory by sliding the SET/RUN switch to RUN. Note SAVE is displayed momentarily and the current day of week and time appear in the display.

NOTE: If you need more programming assistance, request form #158ET9311, Programming Examples, which contains step-by-step instructions for several complex programs.

BATTERY BACKUP
All programmed data is protected by non-volatile memory and can only be changed or deleted by reprogramming, regardless of power outage durations. A factory installed 8-year lithium battery backup maintains accurate time and calendar information.
See Special Instructions for replacement.

SPECIAL INSTRUCTIONS

Enclosure Mounting

The top mounting hole on the enclosure is slotted; it is not necessary to remove the power module unless you want to change the input voltage. Mount the enclosure with #8 or 10 pan head or #6 or 8 hex head screws.
WARNING: Disconnect all power at the service panel before removing the logic module.

Swing Up

Pull

LOGIC MODULE

Removing Logic Module (required for wiring). Pull the retaining tab to the left and lift logic module away on the left side.

STOP: Disconnect cable from rear of logic module by pulling straight back on the cable.

Opening the Logic Module To remove the metal logic module cover, remove the screws on the back and lift off, exposing the circuit board. Reverse steps to replace cover. The following three procedures require cover removal.
Converting to 24 Hour Display Mode The time switch is shipped with 12 hr. AM/PM timekeeping; 24 hr. is available by removing the jumper from the pin connector on the circuit board. The jumper(s) may be stored for later use by reinstalling on the outer pins only.

Daylight Saving Time Override Override the automatic DST adjustment (in Arizona, Hawaii and parts of Indiana) by removing the jumper on the circuit board.

Battery Replacement

The 8 yr. battery is located on the back of the circuit board under the metal battery terminal clips. Replace with Panasonic or Rayovac BR2325 (or equivalent).
SPECIAL INSTRUCTIONS

Pull straight back to disconnect.
Plug straight in to re-connect.
Remove screws to remove metal cover

LOGIC MODULE

BATTERY

PLACE BATTERY PLUS (+) SIDE UP

24 HR
No DST

LOGIC MODULE
(cover removed)

Re-installing Logic Module Carefully plug the 8 wire cable straight into the connector on the rear of the logic module. The sawtooth shape on both connectors must line up to allow the cable connector to be seated. Engage the cut-aways on the right side of the logic module with the guides in the plastic terminal block and snap the left hand side in place. It may be necessary to use a small screwdriver to push the left hand retaining tab slightly to the left to allow the module to snap in place.

Removing Power Module (required to change input voltage or to access rear power input terminals–24 Volt Models)

Remove the logic module. Press up on the metal retaining tab and swing the power module, top first, out of the enclosure.

Tilt Top Forward
Snap Out Catch
Lift Up To Remove

SPECIAL INSTRUCTIONS

Changing Power Input Voltage– Multi-Volt Models
ET70115C, ET70115CR, ET70115CR8, ET70215C, ET70215CR, ET70215C8

These models can be powered by any industry standard 50–60Hz AC voltage, 120 to 277V. To change from the 120VAC factory setting, locate the voltage selector jumper and insert over the pair marked with the desired voltage (208, 240, or 277 VAC).

120V
208V
240V
277V

POWER MODULE
(back view)

Ground
24 Volt Timer Power Wiring– When Using Bell or Thermostat Wire Only (Load Voltage Above 24 Volts)

This timer must be powered by 24 VAC, 60 Hz only. These is no supply voltage adjustment jumper. If load voltage(s) are 24V or less, and/or if the timer power wiring insulation

Two Place Terminal Block

POWER MODULE
(back view)

24 Volt Wiring When Using Bell or Thermostat Wire

Enclosure Wall

is rated for at least 300V, connect timer power to terminal 1 and 2. If load voltages are greater than 24V and the timer power wiring insulation is not rated for at least 300V, such as bell or thermostat wire, feed the timer power wiring through the supplied insulating tube and connect to the two-place terminal block on the back of the power module. Once installed, the tubing must extend beyond the enclosure wall and under the power module so that the timer power wiring remains isolated from the high voltage load wiring.
Load Control Wiring With the logic module removed you have access to the load control relay terminals.

28

## TYPICAL WIRING CONFIGURATIONS (Multi-volt Models)

WARNING: If timer power supply voltage is 208/240/277V, you must move the input voltage selector jumper on the power board. See Special Instructions. 24V models do not have this jumper; connect 24VAC 60 Hz only to 24V timer power terminals.

TROUBLE SHOOTING

Problem	Solution(s)
Display Does Not Light	• Make sure flat cable is properly plugged into the rear of the logic module. Refer to "Re-installing logic module" in Special Instructions. If connector will not install easily, check for bent pins. • On multi-volt models make sure the voltage selector jumper is correctly installed and that matching voltage is present at timer power terminals. On 24V models make sure 24VAC is present at timer power terminals.
Loads Not Switching	• Check wiring. Note the load contacts are isolated to allow you to switch loads with a voltage different than the timer power. You may have forgotten to add the appropriate connections required to power the load contacts. See wiring examples. • Check to ensure all breakers or disconnects have been reset. • Make sure load switches are in Enable position for automatic switching. • After a power interruption all loads will be Off and will "catch up" to the present programmed state as of midnight of the present day. Schedules that turn On one day, then Off one or more days later, need a redundant switch On time at 12:00 A.M. Loads that are operated by pulses (such as latching contactors) may not be restored to the expected condition if any On/Off pulses occurred during the power interruption. Consider using fixed On/Off schedules in conjunction with either self-clearing contactors or contactors adapted for "two wire control". See "Load Controls" for details. • Make sure the SET/RUN switch is set to RUN.

INTERMATIC®
Next Generation

Problem	Solution(s)

Problem   **Solution(s)**

- NOTE: Override intervals or pulses are not ended by scheduled OFF events; they can only be ended by timing out, power interruptions, or by pressing the ON/OFF key. At the termination of an override interval or pulse, the load may be ON or OFF. The load will remain ON only if an ON set point has occurred during the override interval or override pulse.
- Review **SET UP** to see if timer could be following a holiday program with no scheduled activity.

Load Switches at Incorrect Time

- Using the REV function, check program times against the times you entered in the chart.
- Review **SET UP** or observe the flashing "Holiday REF #" light to see if the timer is following a holiday schedule. Holiday dates and schedules from the prior year do not automatically clear or adjust. They must be manually revised or removed annually.
- When using pulse or interval "ON" programming, the load will switch ON at the scheduled time and OFF at that time, plus the pulse or interval duration. For "OFF" pulses or intervals the load will switch OFF at the scheduled time, and ON at that time plus the pulse or interval duration, even if the load was not ON before the start of the "OFF" pulse or interval.
- This timer provides an automatic 15 sec. delay between circuits 1 and 2 when programmed to switch at the same On time (2 circuit models only). Use the Interval or Pulse features to eliminate if required.

Problem   **Solution(s)**

NOTE: ASTRO switching times change daily according to changing Sunrise and Sunset Consider fixed times with this in mind, e.g. a fixed OFF intended to end an Astro ON would be ignored if sunset moves beyond the fixed OFF time. The fixed event should be scheduled to occur outside the range of the Astro event, or an Astro Pulse should be considered.

NOTE: Override intervals or pulses are not ended by scheduled OFF events; they can only be ended by timing out, power interruptions, or by pressing the ON/OFF key. At the termination of an override interval or pulse, the load may be ON or OFF. The load will remain ON only if an ON set point has occurred during the override interval or override pulse.

INTERMATIC
Next Generation

Problem	Solution(s)
Timer Ignores Pushbuttons	• Processor is "locked up". Press and release RESET key while holding down the CLEAR key. Release CLEAR when "reset" appears in display. If no improvement, remove and restore AC power and battery, then re-try.
Difficulty in Programming	• The two most common mistakes are forgetting to press AM or PM after each time entry and forgetting to select a load with the Enable switch. You cannot program switch times (PROGRAM) unless you select a load using the Enable switches. Pressing the HELP key when an error (ERR--) message appears will explain the error and may offer recommended action.
Override Interval or Pulse Won't Start	• An interval or pulse duration must have been previously programmed (check by pressing INTVL or PULSE key in SET mode without selecting a day) and the circuit must be Enabled.
Interval Override Duration Varies	• Actual duration is the programmed duration ±30 seconds.
Switch On/ Off Display Doesn't Alternate During Programming	• After any Pulse or Interval entry, the Switch On or Switch Off LED does not alternate, since most Pulse or Interval applications require only ON or OFF. Press OK without a time entry to alternate the Switch On/Off display if required.

Problem	Solution(s)
Some Switching Times Don't Show During Review	• All review should be done with only one circuit enabled at a time (2 circuit models only). If both circuits are enabled, only events common to both will show during review. To see all possible scheduled events, the *week long* review should be used. Events programmed via Day Group or Copy Day methods will not show when reviewing individual days or vice versa.
Difficulty in Programming/ Reviewing On/ Off Latching Pulse *or* **Output to Latching Contactor Remains On After an Off Pulse**	• When using pulsed output for switching a latching relay or contactor without "self-clearing" contacts, one circuit is dedicated to the load Turn On Pulse and the other to the Turn Off Pulse (2 circuit models only). The pulses are created by turning the respective circuits <u>On</u> momentarily (1 to 2 sec.). Therefore all events must be programmed and will review as <u>On</u> Pulses. The <u>On</u> time(s) of the controlled load will be shown as <u>On</u> Pulses for one circuit and the <u>Off</u> time(s) will review as <u>On</u> Pulses for the other circuit. *Note: Using the manual On/Off keys to switch this type of contactor On or Off will not provide the expected result and may cause damage to the contactor coil. For this application an external Momentary Pushbutton must be added for both circuits. Refer to the Programming Examples booklet for more information.*

NOTE: If you need more programming assistance, request form #158ET9311, Programming Examples, which contains step-by-step instructions for several complex programs.
